

Stock Market

Imagine you own a small piece of a company. If the company does well, your piece becomes more valuable. If it does badly, your piece loses value. That piece is called a **stock** or **share**.

The 4 Price Terms:

Every trading day has 4 prices:

Term	Simple Meaning	Example
Open	Price when market opens in morning	Meta opens at \$1,060
Close	Price when market closes in evening	Meta closes at \$1,050
High	Highest price reached during the day	Meta touched \$1,080
Low	Lowest price reached during the day	Meta dropped to \$1,040

Volume

How many shares were bought and sold that day

- **High volume** — lots of people are interested in that stock
- **Low volume** — not many people are trading it
- Snap's volume spike in 2026 means suddenly everyone started buying or selling Snap shares — usually happens when big news breaks

Growth Index

Measures how much a stock has grown since a starting point

- Start everyone at 1000 (base)
- If Meta doubles in value → Growth Index becomes 2000
- If Snap loses half its value → Growth Index becomes 500
- Easy way to compare stocks that have very different prices

Risk and Volatility

Type	Stock
Low risk	Stable price, small movements
High risk	Wild price swings up and down

- **Volatility** = how bumpy the ride is
- **Snap is most volatile** = its price jumps up and down wildly every day
- **Spotify is least volatile** = its price moves slowly and steadily

Risk vs Return

This is the most important concept in finance:

Higher risk should give higher return — if you take more risk you expect more reward

- **Snap broke this rule** — took highest risk but gave lowest return — worst investment
- **Meta followed the rule** — medium risk, strong return — best investment
- **Ideal stock** = low risk + high return (top left of your scatter plot)

Stock	Risk	Return	Position on Chart
Meta	Medium (0.10)	Positive (0.02)	Top left — best position
Spotify	Medium (0.11)	Positive (0.015)	Top middle — good position
Pinterest	Medium (0.11)	Negative (-0.01)	Bottom middle — weak
Snap	Highest (0.16)	Most Negative (-0.025)	Bottom right — worst position

Avg Daily Return

On average how much did the stock price change each day in percentage

- 4.40% means on average the stock moved 4.40% up or down each day
- Higher number = more active stock
- Social media stocks are known for high daily movements

Positive vs Negative Days

- **Positive day** = stock closed higher than it opened — investors made money
- **Negative day** = stock closed lower than it opened — investors lost money
- Your 50/50 split means these stocks were very uncertain — almost equal chance of going up or down

Drawdown

How far did the stock fall from its highest point

- Like climbing a mountain and then falling back down
- Meta peak was \$1,300 and fell to \$1,000 = 23% drawdown
- Higher drawdown = more painful loss for investors

Bull Run vs Bear Market

These are terms you used in your story captions:

Term	Meaning	Data
Bull Run	Market going UP — everyone is buying	2023-2024 in your charts
Bear Market	Market going DOWN — everyone is selling	2026 decline in your charts

Chart	What it really means
Sparklines + KPIs	How prices moved over time
Candlestick	Day by day wins and losses
Growth chart	Who grew the most over 5 years
Volume chart	When people were most excited about trading
Risk vs Return	Who gave best value for the risk taken
Volatility chart	Whose price was most unpredictable year by year

CALCULATED FIELDS:

Candle Stick Chart:

Difference between Open and Close

SUM([Close])-SUM([Open])

Difference between High and Low

SUM([High])-SUM([Low])

Comparative Growth Performance:

Comparative growth

SUM([Close]) / WINDOW_MIN(SUM([Close])) * 100

Trading Volume Analysis:

Clean Volume

IF RIGHT([Vol.],1) = "K" THEN
FLOAT(LEFT([Vol.],LEN([Vol.])-1)) * 1000
ELSEIF RIGHT([Vol.],1) = "M" THEN
FLOAT(LEFT([Vol.],LEN([Vol.])-1)) * 1000000
ELSE
FLOAT([Vol.])

END

Volume(M)

SUM([Clean Volume]) / 1000000

Risk vs Return Analysis:

Avg Daily Return

WINDOW_AVG(AVG([Close]) / LOOKUP(AVG([Close]), -1) - 1, FIRST(), LAST())

Risk (Std Dev)

WINDOW_STDEV(AVG([Close]) / LOOKUP(AVG([Close]), -1) - 1, FIRST(), LAST())

Yearly Price Volatility by Stock:

Volatility

STDEV([Close])

KPI:

Avg Daily Return %

AVG((([Close] - [Open]) / [Open]) * 100)

Positive Return Days %

SUM(IF [Close] > [Open] THEN 1 ELSE 0 END) / COUNT([Date1])

Negative Return Days %

SUM(IF [Close] < [Open] THEN 1 ELSE 0 END) / COUNT([Date1])

Average Daily Volume

AVG([Clean Volume]) / 1000000
